ABOUT

Front-end developer with a year and a half of production experience, most of it in fintech. I started at PaySpot, a Serbian payment institution, working on their React Native mobile wallet and their internal back-office in React. I am now at Ferili, a lending platform operating in West Africa, where I work across an Nx monorepo of seven Expo and React apps; I built one of them from scratch and led the redesign of another. The parts of the job I enjoy most are the ones that never make it into a demo: payment validation rules, permission prompts, deep links, release builds and the bug list. AI tools are a normal part of how I work now - Claude Code and ChatGPT daily for refactoring, review and research, Pencil for design work and Manus for longer-running tasks. Alongside this I am finishing a degree in Information Technology at the University of Novi Sad, and I have trained martial arts for most of my life, which is where the discipline comes from.

TECHNICAL SKILLS

Languages TypeScript, JavaScript, Java, SQL

Front-end React, React Native (Expo), React Navigation, Expo Router, React Router, Tamagui, SCSS, Storybook

State and data Redux Toolkit, Redux-Saga, Zustand, TanStack Query, Axios, Server-Sent Events

Forms and validation react-hook-form, Zod, Formik, Yup

Tooling Nx, Vite, Metro, EAS Build and OTA updates, Git, Jest, ESLint, Prettier, Docker

AI tools Claude and Claude Code, ChatGPT, Pencil, Manus

Also worked with i18next (SR / EN / FR), Firebase, Spring Boot, MySQL

WORK EXPERIENCE

Ferili *Front-end Developer* April 2026 - present

React, React Native (Expo), TypeScript, Nx monorepo, Zustand, TanStack Query, react-hook-form + Zod, Storybook, i18next

Secured-lending fintech operating across four West African markets. The front end is an Nx monorepo of four React Native apps and three React web apps, and I have delivered work in all of them.

- **Built a new field-agent mobile app from scratch** in React Native and Expo, from an empty repository to production. Role-based navigation for three types of agent, multi-step approval workflows, QR scanning, push notifications and deep linking, in-app document capture and PDF invoice generation.
- **Led the redesign of the customer-facing mobile app, start to finish in around two weeks.** Established the design-token system and shared component library, set up Storybook on React Native Web so components could be reviewed in isolation, and rebuilt around 30 screens spanning onboarding, account overview, contracts, renewals, payments and transaction history.
- **Built the cashier module used by branch staff** to take and release payments. Replaced a set of one-off forms with a single configuration-driven payment flow, then added partial and split payouts, retry handling for failed mobile-money transfers, limits on retry attempts, invoice management, and enforcement of the regulatory ceiling on transaction amounts.
- **Delivered a pricing and configuration module with a maker-checker workflow:** staff submit changes, approvers review a side-by-side comparison of current against proposed values, and edit and delete rights are enforced by role.
- **Integrated AI-assisted identity verification** into the back office, with an approval gate for operations staff and results streamed to reviewers in real time over Server-Sent Events.
- **Resolved the stability issues affecting the most users:** an unresponsive grey screen traced to a navigation drawer misconfiguration, slow and occasionally stalled application startup, deep links that failed when the app was launched cold, and layout breakage following an Android SDK upgrade.
- **Drove code quality across the monorepo** - shared types, state-selector conventions, path aliases and design tokens for spacing and typography - and kept the French and English localisations in step with every release.

PaySpot *Front-end Developer* May 2025 - April 2026

React Native (Expo), React, TypeScript, Redux Toolkit, Redux-Saga, Tamagui, Formik + Yup, i18next

Licensed Serbian payment institution. I worked across three products: the consumer mobile wallet, the internal back-office web application, and a payments integration for self-service car washes.

- **Payment orders and QR scanning.** Built the payment-order form with full validation against the national payment-slip rules, and a scanner for Serbia's instant-payment QR standard that reads a code from the camera, the photo library or a PDF document, validates every field against the specification and pre-fills the order.
- **Wallet operations.** Top-up from saved cards, transfers between wallets, withdrawals to a bank account, and transaction and balance history with date and type filtering.
- **Peer-to-peer transfers.** Sending and collecting money by phone number, with the device contact list integrated into the flow.
- **Card and loyalty management.** Card ordering, naming, spending limits, blocking and unblocking, and status tracking; loyalty cards captured with the camera and rendered on screen as a scannable barcode.
- **Onboarding and application security.** Registration with email and SMS one-time codes, Google and Apple sign-in, PIN and biometric unlock, and video identity verification, plus a hardening pass covering rooted and jailbroken devices, debugger and mock-location detection, screen-capture blocking and a privacy overlay on iOS.
- **Controlled rollout and localisation.** Features shipped behind flags so the business could enable them release by release, with the application fully localised in Serbian and English.
- **Back-office web application (React).** Added a role and permission layer so each team sees only the screens and actions it is entitled to, built new operational reports, extended the system with additional payment methods, and refactored legacy areas of the codebase as the product grew.
- **Car-wash payments.** Built a React web application bringing instant QR payment to self-service car-wash stations, so drivers could pay from their banking app rather than with coins or tokens.

ComData *Front-end Learning Internship* June 2024

Where my front-end work started. Two weeks of learning the fundamentals by working through a steady stream of practical tasks, and my first exposure to a professional workflow outside university projects. I carried on from there under my own steam, with a senior developer mentoring me, and moved into front-end work professionally soon after.

LEARNING PROJECTS

Projects I built while studying, to learn the stack before working with it professionally.

CriticCafé *Social network for film enthusiasts* Solo project

Java (Spring Boot), MySQL, React (TypeScript), Docker

- Full-stack app for sharing film opinions and following other users: friends, recommendations, comments, ratings, private messaging and collections.
- Spring Boot back end with Spring Security for authentication and Google SMTP for email verification; React and TypeScript (Vite) on the front end.
- Guest, user and admin roles, with an admin dashboard for content and category management.
- Containerised with Docker and deployed across Render, Railway and Vercel.

YPlanner *Appointment scheduling for salons* Solo project

React (Vite), Firebase Firestore, Vercel

- Planner for manicure and pedicure professionals: client records, material tracking, appointment slots and session notes.
- Financial reporting with date filtering, showing total earnings, expenses and net profit.
- Firestore for cloud storage, deployed on Vercel.

WebShop *E-commerce platform* Solo project

React (Vite), Firebase Firestore and Storage, Vercel

- Storefront with product browsing, cart and order processing. Guests can browse and fill a cart but have to register and verify their email to check out.
- Firebase Auth for sign-in and email verification, Firestore for data and Firebase Storage for product images.
- Admin catalogue management: adding, editing and deleting products, uploading multiple images and choosing the main one.

Plant Centar and Plant Shop *Website for an agricultural pharmacy* Team project

React (TypeScript), Redux, Firebase Firestore, Vercel

- Informational site for the pharmacy with product categories and details, plus an integrated shop for selling agricultural products online.
- Redux for state management and Firestore for cloud storage, deployed on Vercel.
- Admin interface for managing products and page content.

EDUCATION

Information Technology *University of Novi Sad, Faculty of Sciences* 2021 - present

Department of Mathematics and Informatics, Novi Sad, Serbia

Computer Technician *Electrotechnical School "Mihajlo Pupin"* 2017 - 2021

Novi Sad, Serbia
